Define the Problem Statements

Date	03 October 2026
Team ID	SWTID-2026-5622
Project Name	Script-Controlled ACL – Restrict Access Based on Field Value
Maximum Marks	2 Marks

Customer Problem Statement:

Section	Description	Details for Project
I am	Identify the customer and their situation.	A system administrator who manages user access to important records.
I'm trying to	State what the customer wants to achieve.	Control access based on a specific field value or user role.
But	Describe the difficulty or barrier.	Existing access rules may not provide flexible field-based control.
Because	Explain why the problem exists.	Access decisions are usually based on fixed conditions and may require manual changes.
Which makes me feel	Describe the customer's impact or emotion.	Concerned about unauthorized access and frustrated with manual access management.

EXAMPLE – Script-Controlled ACL

I am

A System Administrator / Access Manager

I'm trying to

Control user access to records based on specific field values

But

Users may receive access even when the field value does not meet the required condition

Because

Existing access rules may not dynamically evaluate field values, requiring additional manual checks

Which makes me feel

Concerned (due to unauthorized access, data exposure, and inconsistent access control)

Problem Statement	PS-1	PS-2
I am (Customer)	A system administrator	A system administrator
I'm trying to	give users access according to a specific field value	automatically control who can view or modify information

But	the existing access rule treats different users too similarly	changing access rules manually takes time and effort
Because	access conditions are not evaluated dynamically	the access policy is not script-driven
Which makes me feel	concerned about improper access	frustrated and less confident in access management

Key Problem Insights:

From the identified customer problems, three important needs were observed,

1. Dynamic Access

- Users should receive access according to the value of a specific field.

2. Automatic Decision

- The system should automatically decide whether access should be allowed or restricted.

3. Better Control

- Administrators should be able to manage access conditions without repeatedly changing multiple rules.

Problem Focus:

How can we make access control dynamic by using a script to evaluate field values and automatically allow or restrict access?

Customer Need:

The customer needs a simple access-control mechanism that can evaluate a field value and make an appropriate access decision automatically.

Expected behaviour:

Field Value → Script Evaluation → Access Decision

For Example:

- **Approved Value → Allow Access**
- **Unapproved Value → Restrict Access**

Why This Problem Matters:

Improper access can expose information to users who should not have permission to view or modify it. A field-based access mechanism can provide more controlled and flexible authorization while reducing unnecessary manual effort for administrators.
