

Ideation Phase

Empathize & Discover

Date	03 October 2026
Team ID	SWTID-2026-5622
Project Name	Script-Controlled ACL – Restrict Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map Canvas:

The Empathy Map Canvas is a user-centered design tool used to understand the needs, concerns, and day-to-day challenges of key platform users—especially ServiceNow Administrators, Developers, and IT Service Desk Agents. By mapping what users think, see, hear, say, do, and experience, the exercise connects technical access-control requirements with real operational needs.

For the Script-Controlled ACL project, the canvas focuses on restricting record access dynamically according to a field value. It highlights the need for reliable security rules, reduced manual checking, predictable behavior, and protection of sensitive records while still allowing authorized users to work efficiently.

Example:

THINK & FEEL? • Worry that unauthorized users may see sensitive records. • Need confidence that access changes automatically when field values change. • Feel that manual permission checks are time-consuming and error-prone.	SEE • Records with different field values and access requirements. • Users receiving different access depending on department, status, or classification. • ACL rules, roles, and security settings that must work together.	HEAR • Administrators ask for secure, maintainable access rules. • Agents report access problems when conditions are unclear. • Teams emphasize protecting confidential information and audit requirements.
SAY & DO • Configure ACLs and test them with multiple user roles. • Use a script to evaluate the target field before granting access. • Verify both allowed and denied scenarios before deployment.	USER / SYSTEM CONTEXT • ServiceNow Administrator • Developer / Application Owner • IT Service Desk Agent • End user requesting record access	PAIN • Static rules may not match changing record conditions. • Incorrect scripts can expose restricted information. • Too many manual checks increase workload and mistakes. • Unclear denial behavior can delay incident resolution.
GAIN • Field-based access is enforced automatically. • Sensitive records remain protected according to business conditions. • Less manual verification and fewer access errors. • Clear, auditable and maintainable security behavior.	EXPECTED OUTCOME • Access is granted only when the configured field value meets the rule. • Unauthorized combinations are denied consistently. • The solution is tested, documented, and easy to maintain.	KEY NEED • Dynamic security control • Reliable field-value validation • Role-aware access enforcement • Safe handling of sensitive records
